

HS Code: Varies by resin type

RESIN (COSMETIC GRADE)

Cosmetic-grade resins are purified natural or synthetic polymeric materials used in personal care, skincare, hair styling, perfumery, and decorative cosmetics. These resins provide film-forming, thickening, binding, gloss-enhancing, and stabilizing properties in formulations.

1. NATURAL COSMETIC RESINS

Natural cosmetic resins are derived from botanical sources and are widely used in natural skincare, perfumes, and organic cosmetic formulations.

Examples include:

- Rosin (Colophony – purified grade)
- Shellac (Cosmetic Grade)
- Dammar Resin
- Benzoin Resin

Natural Resin – General Specification

Parameter	Typical Range
Purity	≥ 95%
Acid Value	Grade dependent
Heavy Metals (Pb)	≤ 10 ppm
Arsenic	≤ 3 ppm
Appearance	Light yellow to amber
Form	Solid flakes / Powder

Applications:

- Lip balms
- Natural perfumes
- Nail polishes
- Hair styling products

Natural resins provide gloss and film formation.

2. SYNTHETIC COSMETIC RESINS

Synthetic cosmetic resins are manufactured polymers designed for controlled consistency, performance, and stability. They are widely used in hair sprays, nail products, mascaras, and long-lasting cosmetic formulations.

Common types:

- Polyvinylpyrrolidone (PVP)
- Acrylates Copolymer
- Styrene-Acrylates Copolymer

Synthetic Resin – General Specification

Parameter	Typical Range
Purity	≥ 99%
Residual Monomer	Within cosmetic limits
Heavy Metals	Cosmetic compliant
Viscosity	Grade dependent
Appearance	White powder or liquid dispersion

Applications:

- Hair styling gels
- Mascara
- Long-wear foundations
- Fixatives and sprays

Synthetic resins provide controlled film strength and durability.

3. FILM-FORMING RESINS

Film-forming resins create a thin, uniform layer over skin or hair to improve adherence, water resistance, and longevity of cosmetic products.

Film-Forming Resin – General Specification

Parameter	Typical Range
Solid Content	20% – 60%
Viscosity	Grade dependent
Drying Time	Fast-setting
Compatibility	Water / Alcohol soluble
Safety	Dermatologically tested

Applications:

- Waterproof makeup
- Long-lasting lipstick
- Setting sprays
- Mascara

4. FUNCTIONAL / THICKENING RESINS

These resins are used as stabilizers, texture modifiers, and suspension agents in creams, lotions, and emulsions.

Functional Resin – General Specification

Parameter	Typical Range
Purity	Cosmetic grade
pH Stability	4 – 8
Compatibility	Oil / Water phases
Appearance	Powder or liquid
Microbial Compliance	Within cosmetic limits

Applications:

- Creams and lotions
- Emulsions
- Gel formulations
- Skincare products
